

retinal detachment surgery pdf

Retinal detachment is a disorder of the eye in which the retina separates from the layer underneath. Symptoms include an increase in the number of floaters, flashes of light, and worsening of the outer part of the visual field. This may be described as a curtain over part of the field of vision. In about 7% of cases both eyes are affected. Without treatment permanent loss of vision may occur.

What is the treatment for retinal detachment? The treatment involves surgery and the main aim of surgery is to seal holes in the retina and reattach the retina.

Retinal detachment surgery - sth.nhs.uk

There are three different types of retinal detachment: Rhegmatogenous [reg-ma-TAH-jenous]â€”A tear or break in the retina allows fluid to get under the retina and separate it from the retinal pigment epithelium (RPE), the pigmented cell layer that nourishes the retina. These types of retinal detachments are the most common. Tractionalâ€”In this type of detachment, scar tissue on the retina's ...

x This review presents updated recommendations, based on existing clinical research, for anesthetic management of strabismus surgery in children. In children, unlike adults, eye surgery nearly always requires general anesthesia, even for brief procedures. Recommendations for preoperative anxiolysis, fasting guidelines, and management of upper respiratory infections are discussed.
